Down in Georgia, in Florida and North Carolina, its yield is all the way from 100 to 200 tons of green fodder per acre. It grows to a height of 18 feet in those states, while a single kernel will produce from 60 to 100 stalks of the most nourishing green fodder imaginable. SUDAN GRASS

It is a tall, annual grass reaching a height of 7 feet when planted in rows and allowed to mature for seed crop; broadcasted and cut in the bloom for hay about 4 feet. The results have been so satisfactory that it is now established one of our permanent forage crops. It is easily cured and handled as a hay crop. Stock of all kinds eat it readily and will leave any other hay for it. The food value is second only to alfalfa. Should not be planted until the soil becomes warm in the Spring. Two to four cuttings per year can be obtained when sown broadcast for hay, the number of cuttings secured depends upon the length of the season and the moisture. The first crop will mature in from 50 to 60 days, and the second crop is ready for harvesting in from 20 to 30 days. Three tons of cured hay per cutting per acre has been secured, and three cuttings made. It is a great drought register and is particularly adopted to semiarid regions. It is an annual and must be seeded each Spring. When seeded in rows 18 to 20 inches apart, drill 4 to 6 lbs. Choicest Varieties of Flower Seeds.

We are Growers of Flower Seeds. We import varieties which can not well be grown here. Our long experience as growers and dealers enables us to procure the Best Seeds from the most reliable growers and thus offer a better quality than small dealers who buy second handed.

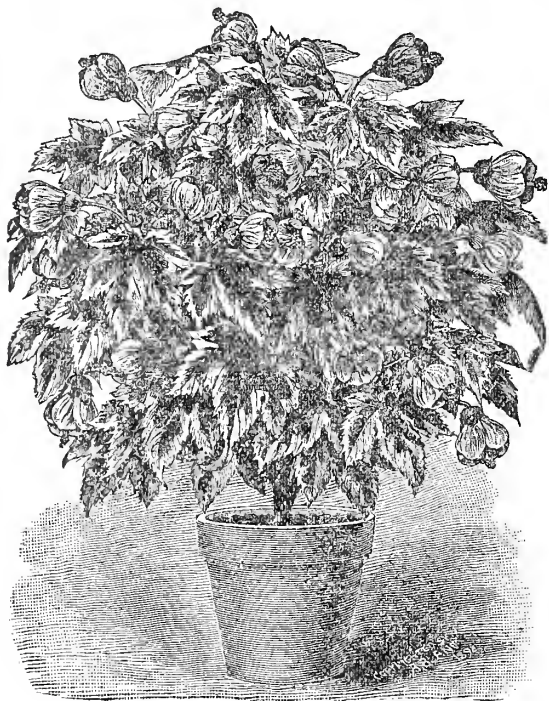

Flowers usually do best in a rich light garden soil not too wet or too dry. Decomposed manure is beneficial to nearly all plants. Asters, Pansies and most bulbs, etc., like plenty of moisture (a rich soil well watered), while Portulacacas will not start till weather is warm. Most plants wanted early can be started in fine soil in a sunny window in the house, great care being taken to keep moist and warm. Some hardy seeds will start well outdoors if sown early, but many will rot if earth is cold and wet. Nice mellow beds can be prepared outside for the harder seeds when weather is warm and they can be transplanted from these when large enough.

Annuals are plants which bloom first season from seed and then perish. Those like Balsams, Nasturtiums and Zinnias, which are easily killed by frost, are called half-hardy annuals. Seeds of these should be sown, if wanted for early, in the house, but most sorts will do better if sown outside in a nicely prepared bed and transplanted to rich soil where wanted. All plants should be kept free from weeds, not crowded, and be well cultivated.

Perennials are our hardy plants which live year after year. Tender Perennials must be kept in house during winter. Hardy Perennials are such plants as Hollyhocks, Sweet William, Rocket, etc. Most of these will not bloom till second season. These and biennials are often benefited by a covering of hemlock boughs, straw or something which will protect from the sun and not smother plants.

Biennials produce plants first season which blossom, mature, seeds and die the second season, such as Canterbury Bell, Digitalis, etc. They require about the same treatment as perennials, and like them are often benefited by a slight covering of evergreen boughs in winter and spring. These should hold the snow and keep sunshine off, but not smother the plants.

Greenhouse Seeds require the greatest care and should be carefully sown in a box or flower pot in light, fine earth, kept at a temperature of about 70 degrees. Always remember they need to be moist (not wet) and warm. A pane of glass over a flower pot or a wet cloth or paper When well up, transplant care-
